

Multiferroics – Review of Classification

(and where to look for a room temperature multiferroic with large, robust and coupled M and P)

Nicola Spaldin
Materials Theory
Department of Materials, ETH Zürich

$$i\hbar \frac{\partial \Psi(\mathbf{r}, t)}{\partial t} = H \Psi(\mathbf{r}, t) \quad i\hbar \frac{\partial \Psi(\mathbf{r}, t)}{\partial t} = \hat{H} \Psi(\mathbf{r}, t) \quad i\hbar \frac{\partial \Psi(\mathbf{r}, t)}{\partial t} = \hat{H} \Psi(\mathbf{r}, t)$$

How to combine M and P?

either

1) use an alternative mechanism for P

or

2) use an alternative mechanism for M

Or play tricks to tip the energy balance in the Second-Order-Jahn-Teller effect

$$i\hbar \frac{\partial \Psi(\mathbf{r}, t)}{\partial t} = H \Psi(\mathbf{r}, t) \quad i\hbar \frac{\partial \Psi(\mathbf{r}, t)}{\partial t} = \hat{H} \Psi(\mathbf{r}, t) \quad i\hbar \frac{\partial \Psi(\mathbf{r}, t)}{\partial t} = \hat{H} \Psi(\mathbf{r}, t)$$

Outline

Mechanisms for ferroelectricity that are compatible with magnetism

Tricking SOJT

Unconventional mechanisms for ferroelectricity

Non-transition-metal magnets

$$i\hbar \frac{\partial \Psi(\mathbf{r}, t)}{\partial t} = \hat{H} \Psi(\mathbf{r}, t)$$

$$i\hbar \frac{\partial \Psi(\mathbf{r}, t)}{\partial t} = \hat{H} \Psi(\mathbf{r}, t)$$

$$i\hbar \frac{\partial \Psi(\mathbf{r}, t)}{\partial t} = \hat{H} \Psi(\mathbf{r}, t)$$

Tricking perturbation theory

Perovskites have many possible instabilities from the ideal cubic phase

Unless the ions happen to pack exactly, rotations will occur

Can disabling one instability favor another?

Plan: turn off tiltings to see if non- d^0 transition metals off-center!

How can we disable tiltings?

Need to increase lattice constant, e.g. with strain or chemical pressure

An example: BaMnO₃

Ghosez, Bousquet et al.: CaMnO₃ shows a tendency to ferroelectricity at *negative pressure* and under strain

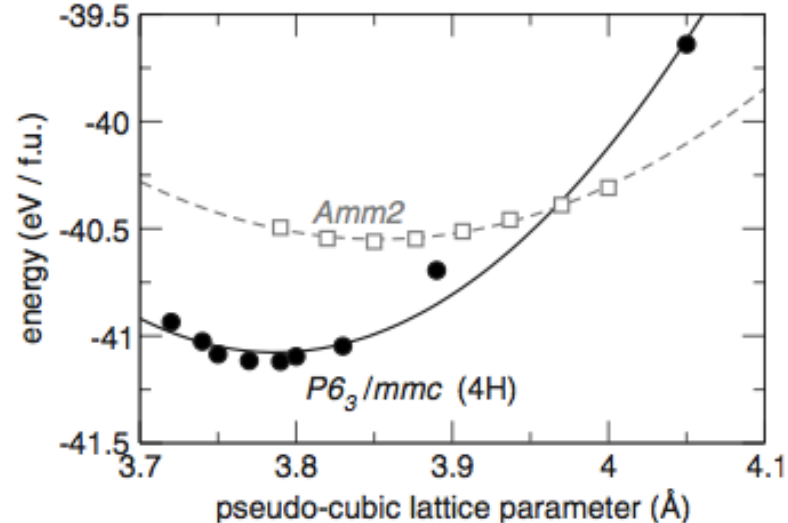

Perovskite BaMnO₃:

Cubic phase: strongly unstable ($200i \text{ cm}^{-1}$) polar zone center phonon
Structural optimization \longrightarrow *Amm2* structure, $P=12.8 \text{ } \mu\text{C}/\text{cm}^2$

$$Z_{\text{Mn}}^* = 9$$

G-type AFM

J. Rondinelli, A. Eidelson and N.A. Spaldin, Non- d^0 Mn-driven ferroelectricity in BaMnO₃, PRB **79**, 205119 (2009)

Recently synthesized by Tokura et al. and shows predicted properties

An example: BaMnO₃

More generally, pushing materials close to or beyond their region of stability induces interesting behavior!

Perovskite structure stable

4H structure stable

CaMnO₃

SrMnO₃

BaMnO₃

perovskite structure
is ferroelectric

lattice constant

Outline

Mechanisms for ferroelectricity that are compatible with magnetism

Tricking SOJT

Unconventional mechanisms for ferroelectricity

Non-transition-metal magnets

Interesting new/ongoing directions (blatant one-sided view)

Novel behavior at interfaces (phase boundaries/domain walls)

Applications in high-energy physics and cosmology

REMINDER – START CHART ON BLACKBOARD

$$i\hbar \frac{\partial \Psi(\mathbf{r}, t)}{\partial t} = \hat{H} \Psi(\mathbf{r}, t)$$

Zoology of multiferroics with unconventional ferroelectricity

Lone pair active

e.g. BiMnO_3 , BiFeO_3

Magnetically driven

e.g. Cr_2BeO_4

R. E. Newnham et al., *Magnetoferroelectricity in Cr_2BeO_4* , J. Appl. Phys. **49**, 6088 (1978)

Geometric ferroelectricity

e.g. BaNiF_4

C. Ederer and N.A. Spaldin, Electric-field switchable magnets: The case of BaNiF_4 , PRB **74**, 020401(R) (2006)

Charge ordered

e.g. LuFe_2O_4

N. Ikeda et al., *Ferroelectricity from iron valence ordering in the charge-frustrated system LuFe_2O_4* , Nature **436**, 1136 (2005)

Magnetically-driven (I) Spiral magnets

e.g. chromium chrysoberyl

R. E. Newnham et al., *Magnetoferroelectricity in Cr_2BeO_4* , J. Appl. Phys. 49, 6088 (1979)

magnetic structure at 4.5K is a cycloidal spiral without an inversion center
spontaneous polarization around 1000 times smaller than in conventional ferroelectrics

“Magnetoferroelectrics might be termed the ultimate impropriety”

Recently rediscovered in $TbMnO_3$

T. Kimura et al., *Magnetic control of ferroelectric polarization*, Nature 426, 55 (2004)

$$i\hbar \frac{\partial \Psi}{\partial t} = \hat{H} \Psi(\mathbf{r}, t)$$

$$i\hbar \frac{\partial \Psi(\mathbf{r}, t)}{\partial t} = \hat{H} \Psi(\mathbf{r}, t)$$

$$i\hbar \frac{\partial \Psi(\mathbf{r}, t)}{\partial t} = \hat{H} \Psi(\mathbf{r}, t)$$

Magnetically-driven II: Superexchange

e.g. HoMnO_3

S. Picozzi et al., *Dual nature of improper ferroelectricity in a magnetoelectric multiferroic*, Phys. Rev. Lett. **99**, 227201 (2007)

Charge-ordered multiferroics

e.g. LuFe_2O_4

N. Ikeda et al., *Ferroelectricity from iron valence ordering in the charge-frustrated system LuFe_2O_4* , Nature 436, 1136 (2005)

Intriguing open question:

Is magnetite below the Verwey transition a charge-ordered ferroelectric?

J. van den Brink and D. Khomskii,
Multiferroicity due to charge ordering,
arXiv:0803.2964

Geometric ferroelectrics

Tiltings in 3-dimensionally connected structures are non-polar

BUT 2-D connectivities can have polar tilt modes!

Geometric ferroelectrics: BaNiF_4 reference structurepolar ground stateAlso YMnO_3 although IMPROPER

Z*s?

C. Ederer and N.A. Spaldin, Origin of ferroelectricity in the multiferroic barium fluorides BaMF_4 : A first principles study, Phys Rev B 74, 024102 (2006)

Lone-pair active ferroelectrics

Exploit two different chemistries

let this ion
be magnetic

and make this
one ferroelectric

Lone-pair active multiferroics: BiFeO_3

Idea:

Ferroelectricity from the “stereochemically active lone pair” on Bi^{3+} (cf ammonia, NH_3)

Magnetism from a 3d transition metal (Fe^{3+})

Find:

Calculate and measure $P = 90 \mu\text{C}/\text{cm}^2$ (huge!)

Epitaxial BiFeO_3 multiferroic thin film heterostructures,
Wang, Spaldin, Ramesh et al., Science 299, 1719 (2003)

BUT: *anti*-ferromagnetic alignment of Fe^{3+} ions

How to introduce a net magnetization?

Magnetic moments in insulating oxides usually anti-align

SO...

try ferr *i* magnetic ferroelectrics

Ferr *i* magnetic ferroelectrics?

Materials Choice:

Double perovskites

Lone pair-active Bi^{3+} on the A-site

Two different $3d$ transition-metal cations on B-site:

e.g. Fe^{3+} (d^5) and Cr^{3+} (d^3)

Mn^{4+} (d^3) and Ni^{2+} (d^8)

Results (Theory and Experiment):

often obtain a ferroelectric polarization (competing rotational instabilities)

reports of ferrimagnetic moments BUT best T_c s around 100K

P. Baettig and N.A. Spaldin, *Ab initio prediction of a multiferroic with large polarization and magnetization*, APL **86**, 012505 (2005).

$$i\hbar \frac{\partial \Psi(\mathbf{r}, t)}{\partial t} = H \Psi(\mathbf{r}, t) \quad i\hbar \frac{\partial \Psi(\mathbf{r}, t)}{\partial t} = \hat{H} \Psi(\mathbf{r}, t) \quad i\hbar \frac{\partial \Psi(\mathbf{r}, t)}{\partial t} = \hat{H} \Psi(\mathbf{r}, t)$$

Outline

Mechanisms for ferroelectricity that are compatible with magnetism

Exploit two different chemistries

let this ion be
ferroelectric

and make this
one magnetic

e.g. strained EuTiO_3 (Fennie and Rabe); $(\text{Eu}, \text{Ba})\text{TiO}_3$

Summary of our discussions

MULTIFERROIC TYPE	large M?	large P?	coupled?	Room Temperature?
<chem>BaMnO3</chem> (Enk 505T)	AFM ↑ ↓ ↑ ↓ NOT IMPOSSIBLE	✓	NO DIRECT	YES P NOT IMPOSSIBLE M
Magnetic Spirals e.g. <chem>TbMnO3</chem>	 NOT BAD	NO	YES	YES = ω_0 = plumbibles (BUT NOT YET IN SAME COMPOUNDS AS M)
Magnetic Supercharge e.g. <chem>HoMnO3</chem>	AFM, FIM NOT IMPOSSIBLE	PREDICTED $\sim 5 \mu\text{C}/\mu\text{m}^2$ RESPECTABLE	YES	UNLIKELY (FRUSTRATION)
CHARGE-ORDERED	✓	✓	SOMEWHAT	400K
GEOMETRIC	AFM, NOT IMPOSSIBLE	✓ $\sim 5 \mu\text{C}/\mu\text{m}^2$	NO DIRECT	YES P, 400K M MAYBE HARDER TO THAN IN 3D
LONE PAIR	AFM, FIM NOT IMPOSSIBLE	✓✓	NO DIRECT	✓
RARE EARTH, 4f MAGNETISM EuTlO ₃	✓	✓	PROMISING INDIRECT	YES P POSSIBLE M (HARD)
